

Reflection

In finishing this appointment, I encountered problems with saving the objects locally using local storage. I have been trying to use `console.log` to see where exactly does my code goes wrong, and have failed to do so with multiple debugging prints. I then realized I can use the developer tool to see what exactly is stored in my local storage with each step that I proceed, and I now see how powerful it is, and gets familiar with it to help with debugging ever since.

After successfully storing these objects in local storage, I tried to retrieve the data from it but failed multiple times. I then went to office hours and realized that I was trying to use a JSON string as an array, thus getting null all the time. Not long after I realized this, I have fixed these bugs and got my entire website up and running. I am grateful that TA's are here to help us with debugging so that we can move on and learn from our mistakes.
